

# Victoria Yurina

Security Engineer

✉ [vikaproekt@gmail.com](mailto:vikaproekt@gmail.com) ☎ [+381 63 7392 811](tel:+381637392811) 📍 Innopolis, Russia 🌐 [Awards](#)

## Summary

Security Specialist with 5 years of experience with Unix/Linux systems, identifying vulnerabilities in web and application services.

Proficient in Java, C, Python, Shell, software architectures, data-flows, and data-protection principles. Passionate about creating stable and secure services. Experienced with software development practices.

Strong analytical and problem-solving skills, effective team player. Had experience in leading diverse international teams. Fluent English skills, excellent verbal and written communication skills.

## Hard Skills

| <b>Innopolis Lyceum</b><br><i>Information Security Trainer</i>                                                                                                                                                                                                                                                                                                                                                | From 2025 |
| Preparing middle-school students for competitions on InfoSec and CTFs. Giving strong theoretical skills (cryptography, Linux, web vulnerabilities, networks, internet protocols, OSI model, etc.) and practical tasks (organizing CTFs every week on local CTFd). My students have earned prize-winning places at the regional stage of the All-Russian Olympiad for School Students in Information Security. |           |
| <b>Distributed Log Analysis using a Custom MapReduce Framework</b><br><i>Python Developer</i>                                                                                                                                                                                                                                                                                                                 | 2026      |
| Built mini MapReduce framework to perform log analysis over large, distributed system logs from web servers. The system supports log splitting, distributed mapping, and result reduction. Useful to count status codes (e.g., 200, 404) from HTTP logs, extract most active IPs or endpoints from server logs, and to analyze error frequency over time with time-bucketed reducers.                         |           |
| <b>StuddyBuddy</b><br><i>TeamLead, DevOps</i>                                                                                                                                                                                                                                                                                                                                                                 | 2025      |
| I worked using Scrum and Agile methodologies, managed the backlog, and estimated product development efforts. I led a team of five developers. On the DevOps side, I was responsible for automating development processes, maintaining infrastructure, setting up CI/CD, and ensuring the stable operation of services.                                                                                       |           |
| <b>RegulIoT</b><br><i>Full-Stack developer, Security Engineer</i>                                                                                                                                                                                                                                                                                                                                             | 2023      |
| Developing tool for automatical exploring vulnerabilities in the devices in Internet of Things local network. Deployed on a RaspberryPi, designing application using Python and Qt software, working with Networks and IoT Protocols, CVE Database.                                                                                                                                                           |           |

| <b>Real-World Blockchain Performance in IoT Networks: Measuring Speed and Security Trade-offs</b>                                                                                                                                                                                                                                                                                                                                                                                                                          | 2025 |
| Investigates how blockchain performs in real-world IoT environments, moving beyond lab-based simulations. Focusing on a hybrid blockchain model, it evaluates transaction speed under dynamic workloads while examining the trade-offs between decentralization, security, and performance. The study provides practical insights and benchmarks to guide effective implementation of blockchain in IoT networks.<br><a href="https://doi.org/10.13140/RG.2.2.29395.54568">https://doi.org/10.13140/RG.2.2.29395.54568</a> |      |
